

Up to 180 cm: freestanding structural lightness by wedi

[Photos for download](#)

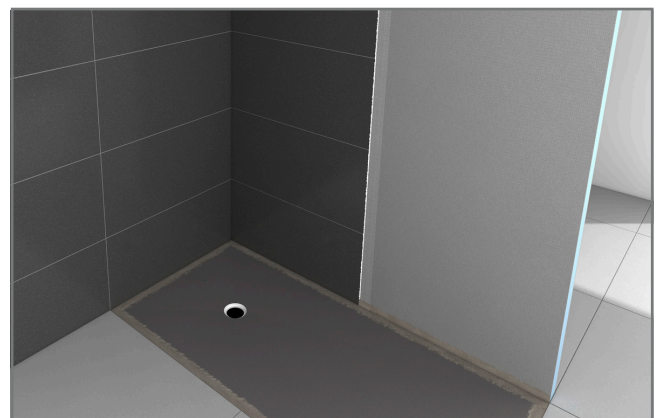

Freestanding partition walls are becoming increasingly important as structuring elements in wet rooms. Space-saving and lightweight solutions that enable room layouts without ceiling support are especially in demand. wedi developed solutions that enable the construction of exactly such partitions – for up to 180 cm in length.

Modern bathrooms are defined by clearly separated zones: shower, toilet, and wash area. These zones give the room structure and ensure an optimal user experience. What's needed are smart solutions that combine functionality and aesthetics – such as slim, freestanding partitions made from lightweight materials.

wedi wall elements combine function and form in perfect harmony. Just two building boards with a thickness of only 8 cm are enough to construct a freestanding wall up to 180 cm long, up to 260 cm high, with remarkable structural stability. The boards are simply bonded using wedi 610 adhesive sealant and can then be tiled directly.

wedi building boards can be cut to size if needed, bonded easily, and tiled directly. They can be installed on almost any substrate. The large-format XL and XXL boards are up to 1.20 m wide, meaning fewer joints during installation. At the same time, they are true "lightweights".
