Wherever people receive medical care, recuperate or engage in sports, everything must work reliably – including what lies beneath the surface. The new Fundo Solido addresses precisely this: beneath the (PVC) surface. The 100% waterproof shower and floor system for barrier-free bathrooms protects the substrate.

At the same time, it is engineered to withstand high point loads. Adaptable to a wide range of installation requirements, Fundo Solido is ready for covering within just 48 hours, supporting rapid construction progress and efficient refurbishment projects — even during ongoing operations.

Fundo Solido reliably protects the entire substrate against moisture — even if the PVC surface becomes damaged. This significantly reduces the risk of mould and concealed moisture damage. For operators, this means high operational reliability and reduced downtime, thanks to clearly limited renovation areas.

Fundo Solido is installed beneath the PVC covering and takes over the sealing function. An additional surface waterproofing layer is not required. The dry installation method and integrated slope eliminate the need for complex screed work and long drying times.

Optional extension boards allow the entire room to be reliably secured. The shower element and extension boards consist entirely of recycled, pressure-resistant PET foam and are designed for high point loads, such as wheelchairs, shower chairs or patient lifts. At the same time, the system is easy to work with. Drainage options include horizontal or vertical DN50 point drains.
